                                                                                                                                                                                                                                                                                                                                                          ò
                     This sequence represents a humanised light chain variable region of murine monoclonal antibody VTM1-1 (MuVTM1-1), an antibody that specifically binds to the B subunit of verocroxin II (VT2). The invention relates to humanised antibodies against VT2 that are capable of neutralizing VT2 and/or VT2 variants. The humanised antibody is a humanized form of MuVTM1-1 comprising the complementarity determining regions of MuVTM1-1 and the heavy and light chain variable region frameworks from the human GF4 antibody heavy and light chain frameworks, provided that at least 1 position selected from L49, H29, H30, H49 and H38 is occupied by the amino acid at the equivalent constitution of the MuVTM1-1 antibody heavy or light chain variable region framework. Such humanized antibodies have an affinity for VT2 that is 3-, 5 or 10-times that of MuVTM1-1. They are used for treating a patient suffering from, or at risk of, the toxic effects from VT2 (claimed), especially for treating verotoxin producing Escherichia coll (VTEC) infection, and haemolytic uraemic syndrome (HUS).
                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                         Gaps

The present sequence represents the variable light chain of humanised antibody 13.17. The antibody is effective in modulating humoral immune response against T cell dependent antigens, collagen induced arthritis and transplant induced rejection. They are also useful for their anti-inflammatory properties. The antibodies have wide therapeutic applications, including autoimmune and inflammatory diseases and transplantation. The antibody can be used in a pharmaceutical composition for treating a patient suffering from a T cell mediated disorder. They can also be used to treat autoimmune diseases, inflammatory diseases,

```

anti-inflammatory properties. The antibodies have wide therapeutic applications, including autoimmune and inflammatory diseases and transplantation. The antibody can be used in a pharmaceutical composition for treating a patient suffering from a T cell mediated disorder. They can also be used to treat autoimmune diseases, inflammatory diseases, and transplantation.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

Patent No. 5693761

GENERAL INFORMATION:

GENERAL INFORMATION:

APPLICANT: CO, Man Sung

APPLICANT: SCHNEIDER, William P.

APPLICANT: COLINGH, Kathleen L.

APPLICANT: OLINGH, Kathleen L.

APPLICANT: SELICK, Harold E.

TITLE OF INVENTION: IMPROVED HUMANIZED IMMUNOGLOBLINS

NUMBER OF SEQUENCES: 113

CORRESPONDENCE ADDRESS:

ADDRESSEE: Townsend and Townsend Khourie and Crew

STREET: Palo Alto

CITY: Palo Alto

STATE: California

Patent No. 5958708
GENERAL INFORMATION:
APPLICANT: Hardman, No. 5958708man
APPLICANT: KOLDINGET, Frank
APPLICANT: Saldanha, Jose
TITLE OF INVENTION: Reshaped monoclonal antibodies against an IITLE OF INVENTION: immunoglobulin isotype
NUMBER OF SEQUENCES: 55
CORRESPONDENCE ADDRESS:

No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.
                                                                                 ; Search time 177.65 Seconds

                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                              IM609 and the antibody vitaxin bind selectively to integrin alphabetas and can be used to inhibit binding of alphabeta3 to a ligand and thus block integrin-mediated signal transduction. This is useful in the treatment, prevention and diagnosis of alphabeta3-mediated disease, specifically angiogenesis and restenosis (but also e.g. (non-)immune inflammation, diabetic retinopathy, neovascular glaucoma, cancer, psoriasis, rheumatoid arthritis, macular degeneration, osteoporosis etc.). The antibodies contain non-murine framework regions so are suitable for use in humans. Enhanced types of IM609 have affinity more than 90 times greater than that of parent the parent antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  tectgtgcageetetggattegettteagtagetatgaeatgtettgggttegeeagatt 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to enhanced LM609 grafted antibodies exhibiting selective binding affinity to alphaVbeta_3 integrin or their functional fragments. The antibodies or their functional fragments can be used in the diagnosis and treatment of alphaVbeta_3-mediated diseases such as angiogenesis, inflammatory diseases (such as psoriasis and chronic articular rheumatism), disorders associated with inappropriate or inopportune invasion of cancer disorders such as tumours and Kaposi's sarcoma), retinal diseases (such as macular degeneration), restenosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 GAAGTGCAGCTGGTGGAGTCTGGGGGAGGCTTAGTGAAGCCTGGAAGGTCCCTGAGACTC
